I would definitely support a JSON output for Bird. Embedding an http server shouldn't be very difficult, and would allow anyone to build its own looking glass using simple javascript.

It's actually what I did for FranceIX: a Bird to JSON wrapper sits on the route-server, and then I just proxy request from an Apache server to pretty print everything. The most complicated part was to write the JSON wrapper, not the front-end. Unix socket with telnet like interface is nice, but a bit outdated when you like at today's available technologies.

My 2 cents ;)

Jerome.

Does anybody know about an open-source looking-glass for BIRD ?

I'm hoping by "open-source" you mean "open-source" as opposed to free... </bugbear>

The only one I'm aware of is:
